Inryeol Choi

Backend Developer

CV - English

Seoul, South Korea | dlsfuf0316@gmail.com |
github.com/InryeolChoi

Profile

Backend developer focused on data flow and preserving live state. I built a Go and SQLite blog that migrated and edits more than 1,400 study notes, and implemented authentication, persistence, AI response integration, and error handling in a Spring Boot service.

Core Strengths

- Understand requirements through data flow, authentication flow, runtime constraints, and operational context, not only through feature lists.
- Built practical fundamentals in processes, file descriptors, networking, and concurrency through C/C++ system projects at 42 Seoul.
- Audited content migration errors and codified correction rules so repeated imports converge.
- Implemented authentication, APIs, and database flows in Spring Boot and Django REST Framework projects.

Skills

Java	Spring Boot	Go	SQLite	C
C++	PostgreSQL	MySQL	Redis	Docker
Nginx	Linux	Git	Django REST Framework	

Experience

PwC Korea - Full-time

2025.04 - Present

Reviewing enterprise IT operating procedures and internal controls while analyzing transaction data flows, system processes, and data consistency.

- Supported control design test analysis and design across about 14 client environments, including e-commerce and fintech.
- Reviewed Java and Kotlin logic alongside Git-based repository histories to understand system behavior and implementation flow.
- Used data consistency checks to understand system structures and control logic.

PwC Korea - Intern

2024.10 - 2025.04

Reviewed enterprise IT operating procedures and internal control documentation, and supported transaction data validation.

- Followed system operation processes to identify processing structures and key control points.
- Reviewed Java logic and GitHub commit logs to understand system behavior and change history.

Selected Projects

AgentTrap - AI agent security testing

Python, Daytona, Nosana, Streamlit | github.com/InryeolChoi/agenttrap

In a two-person team, helped frame the prompt-injection problem and design separate security and email-summary task checks for an AI Defender.

- Compared a normal baseline with the attack; a failed baseline makes the attack result inconclusive.
- Checked unauthorized tool-call attempts separately from completion of required summary facts.

Simsimjogak - Spring Boot backend

Spring Boot, Java, MySQL, Redis, JWT

Built the backend for an emotion-based diary service, connecting social login, diary management, AI letters, and monthly reports into one service flow.

- Implemented Google and Apple social login with JWT refresh flow.
- Built diary create, read, update, delete, and monthly record query APIs.
- Analyzed external AI API response mismatches, adjusted parsing logic, and verified behavior with test cases.

열렬히.뛰기 - Personal blog

Go, SQLite, content migration, live data preservation

Built a Go and SQLite blog with a public site and admin editor, migrating more than 1,400 study notes from Notion and GitHub.

- Audited equation, list, image, and internal-link errors across the migrated content and fixed conversion rules.
- Codified curation rules so repeated imports converge instead of overwriting manual edits.
- Made the server database authoritative, separated deployment from database replacement, and added backups and upload guards.

ft_malloc / ft_irc / minishell / transcendence

C, C++, mmap, pthread, kqueue, Django REST Framework, Docker

Implemented an allocator, network server, shell, and web-service backend through 42 Seoul projects.

- Built zone-based allocation and coalescing, mutex protection, and failure-safe munmap handling in ft_malloc.
- Handled IRC client connections and channel state through an event-driven server structure.
- Converted minishell parsing results into execution structures and implemented pipe-based process chaining.
- Built 42 OAuth, JWT, email-based second-factor verification, and a Docker Compose runtime setup in transcendence.

Education and Learning

Dongguk University

2018.03 - 2025.02 | Management Information Systems, Statistics

Completed a major in Management Information Systems and a double major in Statistics, combining service development, business process understanding, data analysis, and statistical modeling.

- MIS: Business Programming, Cloud Computing Service, Business Process Management, Big Data and Business Analytics.
- Statistics: Statistical Mathematics and R Practice, Regression Analysis, Multivariate Analysis, Data Mining.

42 Seoul

2023.03 - 2024.10 | Project-based software engineering program

Strengthened computer science fundamentals through C/C++ system programming projects and peer review.

- Maintained an intensive project-based learning rhythm of about 160 hours per month.
- Improved collaboration, code review, and problem-solving skills through peer evaluation and team projects.

Award

Daytona HackSprint Seoul 2026 - 2nd Place (participant voting) | AgentTrap | AI Builders | October 18, 2026

Certifications and Other

- SQLD - 2021.12.17
- Big Data Analysis Engineer - 2024.12.20
- Engineer Information Processing - 2026.09.11
- KATUSA, Eighth Army interpretation and administrative support - 2020.09 - 2022.03
